

ABSTRACT OF THE DISCLOSURE

The present invention is a reproducing device includes a memory (26) in which management data including a plurality of data and flags indicating at least whether data out of the plurality of data can be reproduced or not is stored; a reproducing unit (25) for reproducing the data read from the memory (26); an operation unit (22) having an operating element for raising flags for indicating whether the data stored in the memory (26) can be reproduced or not; and a control unit (22) for raising flags on the management data on the basis of an input from the operating element and performing control of reading the data from the memory (26) and control of a reproducing operation of the reproducing unit (25) on the basis of the management data, wherein the control unit (22) reproduces data, other than those on which a flag is raised, of data read from the memory (26) when the data read from the memory (26) is reproduced by the reproducing unit (25).
